GIULIANO BASSO (UNIFR)

Extending and improving conical bicomblings

In this talk I show that every conical bicombing can be extended to the injective hull of the underlying space. As an application, I show that a question of Gromov concerning the convex hull of a compact subset of a $CAT(0)$ space can potentially be answered by solving an analogous problem in the setting of injective metric spaces. I also establish a Descombes-Lang type result stating that every proper metric space with a conical bicombing admits a consistent bicombing satisfying certain convexity conditions. The main tool in the proof is a fixed point argument on the moduli space of all conical bicomblings on the metric space in question.
